The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity

multiple antibiotic resistance.

antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific for C3 convertase, a complement fixing protease. PT-2 is cleaved into 2 distinct effectors in the presence of C3 convertase. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the presence of C3 convertase. Thus, PT-2 was designed to exert optimal antimicrobial activity in the context of activation of one of the in the presence of C3 convertase. Thus, PT-2 was designed to exert optimal antimicrobial activity in the context of activation of one of the context-activated protides of the invention that have 2 or example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions. 88888888888888888888

New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition.

Claim 1; SEQ ID NO 3; 103pp; English.

The present sequence is that of Protide-3 (PT-3), a peptide antibiotide with distinct effector and activator domains. PT-3 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific for thrombin. PT-3 was designed to be cleaved into 2 distinct effectors in the presence of thrombin. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of thrombin,

but equivalent to or exceeding that of RP-1 in the presence of thrombin. Thus, PT-3 exerts optimal antimicrobial activity in the context of thrombin as would be present in the setting of vascular injury or infection. PT-3 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions. 888888888888888

New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition.

Claim 1; SEQ ID NO 4; 103pp; English.

with distinct effector and activator domains. PT-4 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific for matrix metalloproteinase MMP-9, which is produced to dissolve the tissue in front of the growing blood vessel tip to allow for its continued tissue invasion. PT-4 was designed to be cleaved into 2 distinct effectors in the presence of MMP-9. In particular, PT-4 exerts antimoplastic and/or antimicrobial activity less than that of RP-1 in the absence of MMP-9, but equivalent to or exceeding that of RP-1 in presence of MMP-9, Thus, PT-4 exerts optimal antimoplastic and/or antimicrobial activity in the context of new blood vessel formation. PT-4 is an example of context-activated protides of the invention that have 2 The present sequence is that of Protide-4 (PT-4), a peptide antibiotide

The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional attimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

against organisms such as bacteria and fungi comprising a peptide of 5-150 mino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers. The truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The
                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides of the present invention spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rabbit platelet microbicidal protein, PMP-2, based peptide #104.

antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobial, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular boilogy techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZEXEXS and its derivatives selected from XZBBZEXEXE, BXZXZ, BXZXZES and its derivatives as second peptide template XBEXX and their derivatives selected from the group consisting of XBEXBEX, XBEXXES, BXXEXES, and (b) as second peptide template XBEXX and their derivatives selected from the XBEXXESS where B = at least one positively charged amino acid; X = at least one or more other amino acid, and where B, X and Z may be separated by one or more other
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial peptides for potentiating antimicrobial agents active

amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANYS7463 to AAXS7557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antimicrobial peptide composition for use

crivity or for potentiating antimicrobial agents active against represent corpusing such as bacteria and fungi. The AP comprises: (a) a peptide corpusing an amino acid sequence selected from the group consisting containing an amino acid sequence selected from the group consisting selected from XZBBZBXBXB and its derivatives selected from the group consisting a second peptide template XBBXXXBB, XBBXXBBX and BBXZBBX; and (b) a second peptide template XBBXXBBX, BXBXXBB, MBXBXXBB, and XBBZXBBX, MBY BXBXXBB, BXBXXBB, and composition of XBBZXBBX, MBY and zero positively charged amino acid; x = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY5757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                          o;
foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inharent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention describes an antimicrobial peptide (AP) for direct

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acide core sequence (derived from 150 amino acide containing a 7-13 amino acid core sequence (derived from 150 amino acides containing a combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or included are (1) an antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) archimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, against bacteria and fungi, agents in combination with other antimicrobials, against bacteria and fungi, agents in conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short the based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXB, XBBXZXBBX and BBXZBBXZ; and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and consisting of XBBXBBX, XBBXXBBX, BXXBXXB, AZBBXXB, and consisting of XBBZBBX, XBBXXXBX, BXXBXXB, AZBBXXB, and consisting of XBBZBBX, XBBXXBBX, BXZBXB, and consisting of XBBZBBY, XBBXXBBX, BXZBXB, and consisting of XBBZBBY, XBBXXBBX, BXZBXB, and consisting of XBBZBBBY, XBBZXBB, and consisting an incomplete and consisting complete and consisting and consisting and consisting and consisting application of the present invention
spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                     Gaps

The invention relaters to an animalization peptide of 5-
diginate organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from
PMP-1 and PMP-2. platelet microbiocidal protein), and retromers,
truncations, extensions, combinations, fusions and their derivatives. The
possible structures are fully described in the specification. Also
conclusions, extensions, combinations and their derivatives. The
possible structures are fully described in the specification. Also
core sequence selected from truncations of the specific activity
or for potentiating antimicrobial peptide of 13-74 containing an amino acid
core sequence selected from truncations of the specified above,
and retromers, extensions, combinations of the specified above,
and retromers, extensions, combinations and fusions; and (2)
antimicrobial peptides for potentiating antimicrobial activity of
antimicrobial peptides are useful as individual antimicrobial agents,
specifically against bacteria and fungi, agents in combination with other
antimicrobial antimicrobials, agents that enhance the antimicrobial
conventional antimicrobials, agents to improve efficiency of
functions of leukocytes, as disinfectants or preservatives for use in
conventional antimicrobial peptides of prior art have generally
been considered to have undesirable toxicity, immunogenicity and short
convention artivity against pathogens exhibiting multiple antibiotic
conversione problems of toxicity, immunogenicity, and shortness of duration
covercome problems of toxicity, immunogenicity, and shortness of duration
covercome problems of toxicity, immunogenicity, and shortness of duration
covercome problems of toxicity, immunogenicity, and shortness of serum. The present sequence is a rabbit pube based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                           Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                Rabbit platelet microbicidal protein, PMP-2, based peptide #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXXB, XBBXXZBB, and BMXZBXZ, and (b) a second peptide template XBBXXXB, MEMEXXBB, and selected from the group consisting of XBBXBBX, XBBXXBB, BXXBXXB, MEMEXXBB, and XBBZXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid, Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANY57463 to AAN5757 represent sequences

activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBEXKB and its derivatives selected from XZBBZBEXB. BXZXB. BXXZXB. XBBXZXBBX and BBXZBBXZ; and (b) as second peptide template XBBXZXBB XBXXBBX and BBXZBBXZ; and (b) group consisting of XBBXBBX, BXXBBX, XBXZXBB, and XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7461 to AAYS757 represent sequences

ABG69927 standard; peptide; 18 AA. RESULT 38 ABG69927

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide contenting a 7-13 amino acide core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and recromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as becteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial agents, specifically against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficancy of conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in foods and commercies and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of prior art have generally became activity against pathogens exhibiting multiple antibiotic sesitation are based upon natural antimicrobial peptides of prior art have generally resistance. They exhibite lower imherent mammallan cell toxicities and divisition are based upon natural antimicrobial peptides of prior art have generally convertome problems of toxicity immunogenicity, and short and and and approach and antimicrobial peptides of prior art have generally and short inherent mammallance. They exhibite lower inherent mammallance and and antimicrobial participation are passed upon the pathogens exhibiting and approach and and and and and a New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.

Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019310) that exhibit activity elating to eytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    X M X S S X M M X B X H X Y X I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA01310) that exhibit activity elating to prytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or irratment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequented for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                           The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBZBXBXB, BXZXXB, XBBXZXBX and BRXZBBXZ; and (b) a second peptide template XBBXXXB, BXXXBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXXBX, XBBXXXBB, and consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and consisting of XBBZBBX, XBBXXBBX, BXXBXXB, AZBBX, and consisting of XBBZABBX and their derivatives one aromatic amino acid, and where B = at least one positively charged amino acid; X = amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AXF57463 to AAF5757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-

150 amino acids containing a 7-13 amino acid core sequence (derived from the particle and PMP-2.) platelet microbical all protein), and retromers,

CRP1-1 and PMP-2.) platelet microbicalal protein), and retromers,

truncations, extensions, combinations in the specification. Also consible structures are fully described in the specification. Also concentrating antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the covers against organisms such as bacteria and fungi, and (2) antimicrobial peptides for potentiate or restore efficacy of specifically against bacteria and fungi, agents in combination with other specifically against bacteria and fungi, agents in combination with other conventional antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in foods and commetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short considered to bave undesirable toxicity, immunogenicity and short or seet based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicity and short or resistance. They exhibit molecular inherent mammalian cell toxicity and short ore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                     New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                     invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

activity or for potentiating antimicrobial agents active against containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXXB and its derivatives selected from XZBBZBXBXB. BXZXB, XBBXXXBXB and its derivatives selected from XZBBZBXBXB BXZXBX BXXZXBX AND SXZBBXZBX and bear ascoond peptide template XBBXXXBXXB, XBBXXXBBX and BBXZBBXZ; and (b) a second peptide template XBBXX BXXXBXB, XBBXXXBBX, and (b) group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXXBB, and XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rappid apoptosis of microbial cells. AAYS7463 to AAYS7557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an antimicrobial peptide (AP) for direct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                      This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alphablical structure and is believed to act as an ionophore, making holes in bacterial cell membranes. The peptide and antibiotic act synergistically. See AAR13924-R13929 and AAR13936-7. (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alphahalical structure and is believed to act as an ionophore, making holes in bacterial cell membranes. The peptide and antibiotic act synergistically. 2: uniprot_trembl:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: In the elongating spermatids of mammals, the conversion of nucleosomal formatin to the compact, nonnucleosomal form found in the sperm nucleus is associated with the appearance of a small set of basic chromosomal transition proteins.

SUGCELLUAR LOCATION: Nuclear.

SUBCELLUAR SPECIFICITY: Testis.
SIMILARITY: Belongs to the nuclear transition protein 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUE=Testis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -1- FUNCTION: In the elongating spermatids of mammals, the conversion of nucleosomal chromatin to the compact, nonnucleosomal form found in the sperm nucleus is associated with the appearance of a small set of basic chromosomal transition proteins.
-1- SUBCELULAR LOCATION: Nuclear.
-1- TISSUE SPECIFICITY: Testis.
-1- SIMILARITY: Belongs to the nuclear transition protein 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleotide sequences and expression of cDNA clones for boar and bull

protein from rat testis.";

Biochem. Biophys. Res. Commun. 57:341-347(1974).

-!- FUNCTION: In the elongating spermatids of mammals, the conversion of nucleosomal chromatin to the compact, nonnucleosomal form found in the sperm nucleus is associated with the appearance of a small set of basic chromosomal transition proteins.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Testis.
-!- SIMILARITY: Belongs to the nuclear transition protein 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE, VARIANT GLY-27, PHOSPHORYLATION SITES SER-8; SER-35; SER-36 AND SER-39, AND MASS SPECTROMETRY.

FUNCTION: In the elongating spermatids of mammals, the conversion of nucleosomal formatin to the compact, nonuncleosomal form found in the sperm nucleus is associated with the appearance of a small set of basic chromosomal transition proteins.

SUBCELLULAR LOCATION: Nuclear.

TISSUE SPECIFICITY: Testis.

SIMILARITY: Belongs to the nuclear transition protein 1 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

Disclosure; Page 107; 166pp; English.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZENENB and its derivatives selected from XZBENENBS, BXZXZB, XBEXZENBX and BEXZBEXZ; and (b) a second peptide template XBEX may account the group consisting of XBEXENBX, BXXENSB, XBEXZENB, and (b) as a cond peptide template XBEX bear of derivatives selected from the group consisting of XBEXENBX, BXXENSB, XBEXZENB, and (b) at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid core sequence (derived from 150 amino acida containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, runcations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also contained are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial agents that enhance, potentiate or restore efficacy of antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in thoology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

ö
been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The invention relates to an antimicrobial peptide composition for the second and the composition of the invention relates to an antimicrobial protein), and retroners, the invention relates to combinations, fusions and their derivatives from possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of entimicrobial antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in considered to have undesirable toxicity, immunogenicity and short conventions and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibicitic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXENB and its derivatives selected from XZBBZBXENB. BXZXZB, XBBXZXBB and its derivatives selected from the group consisting of XBBXBX, BXXZB, XBBXXZB, XBBXZBBX; and (b) a second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBX, XBBXXBB, BXXBXB, XBBXXBB, and and consisting of XBBXBX, XBBXXBB, BXXBXB, BXBBXXB, and and activatives selected from the group consisting of XBBXXBBX, XBBXXBB, BXXBXB, BXBBXXB, and and activatives and where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AX57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                              Gaps

euthorytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial against bacteria and fungi, agents in combination with other specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in functions of leukocytes, as disinfectants or preservatives for use in bology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbicidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13.74 containing an amino acid and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of invention relates to an antimicrobial peptide composition for use

Sequence 18 AA

```
The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against activity or for potentiating antimicrobial agents active against conganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXXZXB, XBBXXZBB, and BMXZBBXZ, and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBX, XBBXXBB, BXXBXB, XBBXXXBB, and their derivatives selected from the group consisting of XBBXBX, XBBXXBB, BXXBXXB, ARBZXXBB, and their dark one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells.AAX57451 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

and retromers, extensions, combinations of the periods described above, and retromers, extensions, combinations of the solutions; and (2) antimicrobial peptides for potentiating antimicrobial activity of entimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or reserve efficacy of conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular belongy techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 anino acids cortaining a 7-13 amino acid core sequence (derived from PMP-1, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                    Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXENEM and BRXZBRXING SELECTED FOR XZBBZBRXB, BXXZXBX, MBRXZBBX and BRXZBBXZ, and (b) selected from XZBBZBRXB, XBBXXBBX, WASZR, XBBXXBBX, WASZR, ABXZBBX, WASZR, MBXZBBX, BXXBXXBBX, and (b) group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXBB, and A Least one non-polar hydrophobic amino acid, Z at least one aromatic amino acid, and where B, and Z amy be separated by one or more other amino acid. The peptides can be used to treat bacterial and fungal neutrophils. The peptides also increase the antimicrobial activity of apoptosis of microbial effect cellular disruption and rapid apoptosis of microbial cells. AAVS7463 to AAVS7557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.
                                                                                                                                                                  Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to an antimatorbial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from 150 maino acids containing a 7-13 amino acid core sequence (derived from 150 maino acids containing a 7-13 amino acid core sequence (derivatives from 150 maino acids combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also conformed are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance the tenantimicrobial antimicrobials, agents that enhance the antimicrobial activity of conventional antimicrobials, agents that enhance the antimicrobial for specifically against bacteria and fungi, agents in combination with other functions of leukocytes, as disinfectants or preservatives for use in foolay techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and comment in a rabbit in mammalian cell toxicity, immunogenicity, and shortness of effectiveness due to biodegradation, retaining activity in plasma and companies.
                                                                                                                                                                                                                                                                                                                                                                                                                           New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXXZXB, XBBXZXBB and its derivatives accord peptide template XBBXXXB, BXXZXB, XBBXXXBB, and BBXZBBXZ; and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXXBB, BXXBXXB, MSBZXXBB, and C a second peptide template ABBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and C at least one non-polar hydrophobic amino acid, Z at least one positively charged amino acid; X a mino acids and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AMST7463 to AAMST757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

Synthetic

Antimicrobial peptide OC, 19C-RP-1 SEQ ID NO:40.

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, runcations, extensions, combinations, funcions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial activity of conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of prior art have generally because are based upon natural antimicrobial peptides of prior and and broad are based upon natural antimicrobial peptides and and peptides of the preservatives and ender the ender of an ender invention are based upon natural antimicrobial peptides and and peptides and ender invention are based upon natural antimicrobial peptides and and peptides and ender invention are based upon natural antimicrobial peptides and and peptides and ender invention are based upon natural antimicrobial peptides and ender ender invention and prave and state and ender ender and ender ender and ender ender and en
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXXB and its derivatives selected from XZBBZBXBXB. BXZXB. BXXZXB. XBBXXZBX and its derivatives selected from the group consisting of CHAPTER SERVERS. SERVERSES and Chair derivatives selected from the group consisting of XBBXBXX. BXXXBXB, XBBXXXBBX, and (b) XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7461 to AAXS757 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                             Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.
                                           Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rabbit platelet microbicidal protein, PMP-2, based peptide #38.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and retromers, extensions, combinations and fusions; and retromers, extensions, combinations and fusions; and retromers, extensions, combinations and fusions; and antimicrobial apptides for potentiating antimicrobial activity of leukocytes against useful as individual antimicrobial agents, actually against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in functions of leukocytes, as disinfectants or preservatives for use in conventional antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PWP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                  The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above,
                                                                                                                                                                                                                                         peptide composition for the prevention and treatment of by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXKB and its derivatives selected from XZBZBXKBXB and its derivatives as second peptide template XBXX MXXBX BXXXXBXB and BBXZBBXZ; and (b) a second peptide template XBXX MXXB BXXXBBX and BBXZBBXZ; and (b) group consisting of XBBXBXX BBXX BBXXXBBX, XBBXXXBB, and XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular distuption and rapid apoptosis of microbial cells. AAYS7463 to AAYS7557 represent sequences
                                                 The present invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                  The invention features to an antimulational peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, placelet microbiocidal protein), and retromers,
truncations, extensions, combinations, funions and their derivatives. The possible structures are fully described in the specification. Also concluded are (il) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fungio. The antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial complexity of functions of leukocytes, as disinfectants or preservatives for use in conventional antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short of a pased upon natural antimicrobial peptides of that pased upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic or esistance. They exhibit lower inherent mammalian cell toxicity and shortness of duration of effectiveness due to biodegradation, relaining activity in plasma and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, realistances of secture of secure is a rabbit pwe and antimicrobial peptides are abased upon natural antimicrobial peptides that the present sequence is a rabbit pwe antimicrobial peptid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is that of Protide-1 (PT-1), a peptide antibiotide with distinct effector and activator domains. PT-1 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific for staphylococcus VB protease. PT-1 was designed to be cleaved into 2 designed to exert antimicrobial activity less than that of RP-1 in the presence of VB protease. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of VB protease produced by Staphylococcus aureus. Thus, PT-1 was designed to exert optimal antimicrobial activity in the context of infections due to staphylococcus called phase synthesis. It is an example of context-activated protides of the invention that have 2 or nore corresponding activator sites that can each initiate or amplify the biological functions and one or more effectors with individual distinct biological functions and one or more effectors with individual distinct biological functions and one or more effectors with individual distinct biological functions and one or prological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBZBXBXBX, BXXZXB, XBBXXXBX and BXZBBXZ; and (b) a second peptide template XBBXXXBX, BXXXBX, XBBXXXBS, and consisting of XBBXBXBX, XBBXXBX, BXXXBX, XBBZXXBB, and XBBXXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AX757463 to AAX5757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit.
                                                                                                                      Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

and retromers, extensions, combinations and fusions; and (2)
antimicrobial peptides for potentiating antimicrobial activity of
antimicrobial peptides for potentiating antimicrobial activity of
antimicrobial peptides are useful as individual antimicrobial agents in combination with other
antimicrobial, agents that enhance, potentiate or restore efficacy of
conventional antimicrobials, agents that enhance the antimicrobial
cunctions of leukocytes, as disinfectants or preservatives for use in
thurstions of leukocytes, as disinfectants or preservatives for use in
conventional antimicrobial peptides of prior art have generally
been considered to have undesirable toxicity, immunogenicity and short
care based upon natural antimicrobial peptides of the present invention
are based upon natural antimicrobial peptides that have potent and broad
spectrum activity against pathogens exhibiting multiple antibiotic
resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                               against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
